What Else Will We Ban?

Some people notice that modern society prohibits many things that seemed regular to the world community that lived several centuries ago. In this regard, some of them are confident that prohibitions should not be a frequent practice and are not necessary. Nevertheless, a study of the influence of cars, plastic, chewing gums, plants, garbage, animal testing, escalators, banks, advertising, and weapons proves that each of these things must be changed, or banned partially or entirely.

Considering the issue of prohibitions that are necessary for modern society, it is impossible not to begin the discussion with laws that could protect the nature and health of communities. The most regular way to destroy the nature that people are applying now is the use of personal cars. This approach destroys the purity of air, creates smog, and affects the congestion of roads in major cities. Therefore, the banning of personal cars is a guarantee for the prosperity of society, as it will allow us to develop public transport and help people to use enormous roads in a more pleasant form.

In addition, the use of plastic should also be reduced, since this material can pollute the environment for centuries. The most common and problematic issue in this matter is the distribution of plastic bags that people use to buy and store food. Such packages can be replaced easily with reusable options and bags that are made of natural materials. In this way, the distribution of plastic bags should be prohibited by law, which will allow future generations to improve the environment and develop an industry to create storage methods that does not pollute nature.

Moreover, some gastronomic preferences of people are also capable of worsening the environment. One of the most popular ways to freshen one's breath after a meal is the usage of chewing gums. Modern industries create thousands of kinds of these inedible and sweet delicacies. The problem with this approach is that chewing gum does not decompose and can be glued to asphalt and other objects tightly. Because of this, many cities are covered with dirt more quickly. Some countries have already banned the distribution of this product, and this practice should be introduced around the world.

Many researchers are concerned about the impact of modern industries on the state of the environment. Large factories and plants create many useful things that are necessary for consumers. Nevertheless, as demand increases, business representatives are forced to accelerate production and use more chemical and non-natural materials for their products. Progress cannot be stopped and is not a problem in contrast to emissions that can be obtained from large-scale production. In this regard, it is crucial to create a legislative ban on the discharge of production wastes into the environment, as this can damage natural objects and destroy ecosystems.

The above topics can also be reduced into another ban of the distribution of waste that humanity creates. Although many large countries already use systems for garbage processing, some nations do not seek to develop this useful industry. The short-term perspective shows that the establishment of processing plants is an expensive and complicated process. However, in the long term, such an approach can rid the whole country of garbage dumps and other problems that are associated with the accumulation of waste. This fact proves that the refusal of garbage processing should be banned in all countries in order to destroy this threat.

Furthermore, the issue of animal protection is also acute at present. The development of cosmetic and medical industries requires the study of many products that are created for sale. Because of this need, laboratories test many substances on animals, which includes harsh treatment. This method cannot be changed at present, because there is no alternative. At the same time, the law should regulate this process and create all conditions for the animals not to suffer during experiments until an alternative method for the development of drugs and substances is found.

Nonetheless, not only is the environment and animals in need of protection, but also communities that are compelled to exist in a world that is not ready to change according to their needs. The most problematic aspect in this area is escalators. This mode of transportation is used in shops and shopping centers, but it is not convenient and practical for people with disabilities. Trolleys, strollers, and other options for carrying baggage can also not be used while moving on an escalator. Therefore, it is essential to prohibit the use of such methods and replace them with elevators and travelators that are convenient for people with different needs.

Despite the development of the information technology industry, some businesses do not seek to improve at the expense of new methods. Banks are the most problematic businesses in this case, as they conduct many operations manually. This approach increases the number of errors that are committed by a person and creates problems for the provision of a variety of services. Even a simple transaction can take several weeks if workers recheck information. Therefore, it is essential to minimize the participation of people in banking operations and develop software that can help people make money transactions as quickly as paying for

purchases in a store.

Since most modern communities live in metropolises, the issue of comfort is critical for these areas. One of the most significant problems of big cities is advertising that fills all the main streets. People have to read and view thousands of messages that make them buy goods and services. This factor can affect the mental health and mood of people, as they are exposed to a considerable amount of unnecessary information. In this regard, the restriction or prohibition of advertising on the main streets of cities can be a useful option for improving the moral state of citizens who can relax on the way to work or home.

Lastly, many people debate on the need for self-protection and the means of it. Some of them are sure that every citizen deserves to have weapons in one's home to shoot a thief or murderer, while others believe that such an approach only increases the number of suicides and murders. The most significant fact about this question is that weapons are one of the most dangerous methods that allow people to protect each other. Thus, it would be useful if the world community decided to ban any weapon from around the world in order to create a prosperous society that spends resources on creation and not destruction.

In conclusion, a review of habitual things and factors shows that most of the activities of modern humans are associated with things that can and should be banned or changed. At the same time, this list is partial and covers only the most dangerous and harmful phenomena that people face. Therefore, it is necessary to support initiatives and prohibitions that allow getting a positive long-term effect.
